

QUIZ QUESTION BANK | YEAR 7-10 | 38 QUESTIONS

WATER SAFETY

QUIZ QUESTION BANK

Quiz Question Bank | Year 7-10 | All Year Levels

38 questions across 6 sections.

Multiple choice, true/false, short answer, and analysis.

Compatible with Kahoot, Quizlet, and printed quizzes.

Section 1 — Victorian Drowning Statistics

Q1

Easy

MC

How many Victorians drowned fatally in 2023-24?

- A. 32
- B. 54 ✓
- C. 48
- D. 67

Answer: B — 54. Highest Victorian toll in over a decade (LSV 2023-24)

Q2

Easy

MC

How many 2023-24 Victorian drowning deaths occurred at patrolled locations?

- A. 5
- B. 12
- C. 0 ✓
- D. 3

Answer: C — Zero. All 54 deaths occurred at unpatrolled locations.

Q3

Easy

MC

What percentage of 2023-24 Victorian drowning deaths were male?

- A. 54%
- B. 72%
- C. 80%
- D. 85% ✓

Answer: D — 85%

Q4

Medium

MC

Victorian non-fatal drownings in 2023-24 were what percentage above the 10-year average?

- A. 20%
- B. 40%
- C. 60% ✓
- D. 80%

Answer: C — 60% above the 10-year average

Q5

Medium

Calc

Calculate the Victorian drowning rate per 100,000 for 2023-24 (population 6.9 million).

Answer: Rate = $54 / (6,900,000 / 100,000) = 0.78$ per 100,000

Q6

Hard

Analysis

CALD communities represent approx 28% of Victoria's population but 40% of drowning deaths. Calculate the over-representation ratio and explain ONE structural cause.

Answer: Ratio = $40/28 = 1.43$. Structural cause: lack of swim access, cultural/language barriers, etc.

Section 2 — Beach Flags, Rip Currents & Signals

Q7

Easy

MC

What do red and yellow flags at a beach indicate?

- A. Dangerous conditions — do not swim
- B. Safe swimming zone — swim between flags ✓
- C. Marine danger
- D. No inflatables

Answer: B — Safe swimming zone with lifeguard supervision

Q8

Easy

MC

What does a single red flag at a beach mean?

- A. Swim between these markers
- B. No inflatables allowed
- C. Dangerous conditions — do not swim ✓
- D. Marine creatures present

Answer: C — Dangerous conditions. Do not swim here.

Q9

Easy

MC

What does a purple beach flag indicate?

- A. Safe for surfboards
- B. No swimming
- C. Marine danger ✓
- D. Rip current present

Answer: C — Marine danger (e.g. jellyfish, shark sighting)

Q10

Medium

MC

You are caught in a rip current. What should you do FIRST?

- A. Swim directly back to shore as fast as possible
- B. Stay calm and float — do not fight the rip ✓
- C. Signal by waving both arms
- D. Dive underwater to escape the current

Answer: B — Stay calm and float. Swimming against a rip exhausts you.

Q11

Medium

MC

To escape a rip current once you can swim, which direction should you go?

- A. Directly back toward shore
- B. Deeper water
- C. Parallel to shore ✓
- D. Into the rip

Answer: C — Swim parallel to shore to exit the rip, then angle back.

Q12

Hard

SA

If you need help in the water, what is the correct distress signal — and why is this different from waving both arms?

Answer: Raise ONE arm straight up and hold it still. One raised arm is the recognised distress signal — waving can be mistaken for a wave or greeting.

Section 3 — Emergency Response — DRS ABCD

Q13

Easy

MC

What does the D in DRS ABCD stand for?

- A. Defibrillation
- B. Danger ✓
- C. Drowning
- D. Diagnosis

Answer: B — Danger. Check the scene is safe before approaching.

Q14

Easy

Order

Put these DRS ABCD steps in the correct order: Airway, Danger, CPR, Response, Breathing, Send for Help, Defibrillation.

Answer: D – R – S – A – B – C – D (Danger, Response, Send, Airway, Breathing, CPR, Defib)

Q15

Easy

MC

What is the correct CPR chest compression ratio and rate?

- A. 15:2 at 80 bpm
- B. 30:2 at 100-120 bpm ✓
- C. 5:1 at 100 bpm
- D. 30:2 at 60 bpm

Answer: B — 30 compressions : 2 breaths, at 100-120 beats per minute

Q16

Medium

MC

What is the main purpose of opening the airway (Step A in DRS ABCD)?

- A. To check for injuries
- B. To prevent the tongue blocking the throat ✓
- C. To insert a breathing tube
- D. To check for a pulse

Answer: B — Tilting the head back stops the tongue falling back and blocking the airway.

Q17

Medium

T/F

True or False: You should always move a suspected spinal injury patient before starting CPR.

Answer: False — do NOT move a potential spinal injury patient unless they are in immediate danger.

Q18

Hard

SA

What is secondary drowning and what action should ALWAYS follow any submersion — even if the person seems fine?

Answer: Secondary drowning = delayed pulmonary oedema developing hours after submersion. ALWAYS seek medical assessment after any submersion, even if the person appears recovered.

Section 4 — SwimSafe Rules, Inland Waterways & Decisions

Q19

Easy

MC

Which of the following is SwimSafe Rule 2?

- A. Swim with a friend
- B. Signal for help
- C. Enter feet first ✓
- D. Read the signs

Answer: C — Enter Feet First. Never dive into unknown water.

Q20

Easy

MC

What does SwimSafe Rule 5 require you to do if you need help in the water?

- A. Shout loudly
- B. Raise ONE arm and hold it up ✓
- C. Wave both arms
- D. Blow a whistle

Answer: B — Raise ONE arm straight up and hold it there. This is the distress signal.

Q21

Medium

MC

Why are inland waterways (rivers, dams) considered MORE dangerous than patrolled beaches?

- A. They are deeper
- B. They have stronger currents
- C. No lifeguards, depth changes, cold water, remote locations ✓
- D. More people use them

Answer: C — No lifeguards, constantly changing depth, cold water shock, remote rescue delay.

Q22

Medium

MC

A group of friends dares you to jump from a bridge into a river you have swum in before. What is the safest response?

- A. Jump because you know the river
- B. Refuse and leave ✓
- C. Check the depth then jump
- D. Let someone else go first

Answer: B — Refuse. Peer pressure near water causes preventable deaths. Familiarity creates false confidence.

Q23

Hard

SA

Explain why "the water looks shallow enough from here" is an unreliable way to assess depth before jumping or diving.

Answer: Visual depth assessment is unreliable: water clarity, light refraction, sandbanks, and seasonal depth changes all make visible depth misleading.

Q24

Hard

Analysis

Name THREE specific hidden hazards at inland waterways that are invisible from above the surface.

Answer: Any three: submerged rocks/logs/debris/shopping trolleys, sandbanks, cold water layers, underwater weeds/vegetation, irrigation debris.

Section 5 — Personal Action Plan & Community

Q25

Easy

MC

What does it mean to "throw, not go" in a rescue situation?

- A. Throw your phone to call for help
- B. Throw a rope or floating object instead of entering the water ✓
- C. Throw your swimming gear off first
- D. Throw water at the person to wake them

Answer: B — Never enter the water to rescue an untrained person; throw a rope, noodle, towel, or anything that floats.

Q26

Medium

MC

The bystander effect in an emergency means people are LESS likely to help when others are present. What is the solution?

- A. Shout loudly at everyone
- B. Direct a specific named individual with a specific task ✓
- C. Call 000 yourself without telling anyone
- D. Wait for someone else to act first

Answer: B — Name a specific person and give a specific instruction: "You in the red shirt — call 000 now."

Q27

Medium

SA

What is the 1-10-1 Rule in cold water survival?

Answer: 1 minute to control gasping; 10 minutes of useful swimming ability; 1 hour before hypothermia causes unconsciousness. Each window requires a different survival response.

Q28

Hard

SA

Name THREE target groups that are disproportionately at risk of drowning in Victoria and explain ONE structural factor for each.

Answer: Any three of: Males (masculinity norms); CALD communities (swim access, language barriers); children (supervision gaps); adults >65 (cardiac risk in cold water); rural residents (inland waterways, delayed rescue).

Q29

Hard

Analysis

Your school has \$5,000 to improve water safety. List two specific actions and explain which has stronger evidence for impact.

Answer: Strong evidence: CPR training (addresses survival); subsidised swim lessons for identified high-risk students. Weaker evidence: awareness posters alone. Justify with reference to structural vs individual approaches.

Q30

Hard

SA

What is the difference between health equality and health equity in the context of water safety?

Answer: Equality = same provision for everyone. Equity = different provision based on different need. Equity recognises that CALD communities and low-SES groups face greater barriers and need targeted resources, not just equal access to the same programs.

Section 6 — Diving, Spinal Injuries & High-Risk Teenage Behaviour

Q31

Easy

MC

Unsafe diving accounts for approximately what percentage of all spinal cord injuries in Australia?

- A. 2%
- B. 5%
- C. 10% ✓
- D. 25%

Answer: C — 10%. Unsafe diving also accounts for 20% of all quadriplegia cases. Source: AIHW.

Q32

Easy

MC

What percentage of Australian aquatic spinal injury patients are male?

- A. 65%
- B. 75%
- C. 85%
- D. 95% ✓

Answer: D — 95%. This reflects masculinity norms and peer pressure, not biology. Source: Royal Perth Hospital.

Q33

Easy

MC

Which age group has the HIGHEST incidence of diving-related spinal injuries in Australia?

- A. 10-14 years ✓
- B. 15-19 years
- C. 20-24 years
- D. 25-29 years

Answer: A — 10-14 years. Directly relevant to Year 7-8 students. Source: AIHW.

Q34

Medium

MC

A teenager dives from a jetty at a familiar location and suffers spinal injury. A sandbank had formed since their last visit. This best illustrates which concept?

- A. Cold water shock
- B. False confidence from prior experience ✓
- C. Bystander effect
- D. Peer pressure

Answer: B — False confidence. Bawley Beach jetty (NSW 2024). Prior safety does not guarantee current safety.

Q35

Medium

MC

Why does a cervical spine diving injury often cause permanent quadriplegia?

- A. The force of impact is always fatal
- B. Cold water worsens spinal injuries
- C. Spinal cord neurons cannot regenerate after severance or compression ✓
- D. Quadriplegia is only caused by diving

Answer: C — Spinal cord neurons cannot regenerate. 66% of patients permanently disabled.

Q36

Medium

T/F

True or False: "Clear water means deep water — it is safe to dive."

Answer: False — water clarity is unrelated to depth. Dangerously shallow water can be crystal clear. Always check depth physically.

Q37

Hard

SA

Royal Life Saving Australia states more people drown in inland waterways than any other location in Australia. Identify THREE specific factors that make inland waterways more dangerous than patrolled beaches, and explain the mechanism for each.

Answer: Any three of: (1) Depth changes constantly — drought/floods/sediment/dam releases create hidden shallow zones; (2) Poor visibility — submerged rocks/logs/debris invisible beneath turbid water; (3) Cold water shock — triggers gasping reflex and muscle failure even in hot weather; (4) Remote rescue delay — limited phone reception, no lifeguards, difficult road access worsen outcomes; (5) Alcohol and group risk-taking — common combination that multiplies risk.

Q38

Hard

Analysis

The data shows 95% of aquatic spinal injury patients are male. A student argues: "Males are naturally more reckless." Using the social determinants framework, explain why this is insufficient and give a more complete structural account.

Answer: Structural account: masculinity norms (cultural expectation to accept dares, not show fear), peer group reinforcement in group settings near water, social reward for risk-taking, suppression of fear responses as gendered expectation. Effective prevention must change the social norms, not just inform individuals.
